L'abrégé

Texte du l'abrégé : COPD has significant psychosocial impact. Self-management support improves quality of life, but programs are **not universally available**. IT-based self-management interventions can provide home-based support, but have mixed results. *We conducted a case series of an off-the-shelf Internet^{-based} health_{-promotion} program, The Preventive Plan (TPP), coupled with Nurse-coach support, which aimed to increase patient activation and provide self-management benefits.* [Label="BACKGROUND"]

Texte du l'abrégé : A total of **19 COPD patients** were recruited, and 14 completed 3-month follow-up in two groups: **groups 1 and 2 or 3 with more and less advanced COPD**, respectively. Change in patient activation was determined with paired t-tests and Wilcoxon signed-rank tests. Benefits and user experience were explored in semistructured interviews, analyzed thematically. [Label="METHODS"]

Texte du l'abrégé : Only group 1 improved significantly in activation, from a lower baseline than group 2; group 1 also improved significantly in mastery and anxiety. Both groups felt significantly more informed about COPD and reported physical functioning improvements. Group 1 reported improvements in mood and confidence. Overall, group 2 reported fewer benefits than group 1. Both groups valued nurse-coach support; for group 1, it was more important than TPP in building confidence to self-manage. The design of TPP and lack of motivation to use IT were barriers to use, but disease severity and poor IT skills were not. [Label="RESULTS"]

Texte du l'abrégé : Our findings demonstrate the feasibility of combining nurse-coach support aligned to an Internet-based health resource, TPP, in COPD and provide learning about the challenges of such an approach and the importance of the nurse-coach role. [Label="DISCUSSION"]

Autre résumé : An important part of managing COPD is self-management by the patient. With IT-based self-management programs, patients can do this from their own home, which is easier for them and more cost-effective for the health care provider. Our goal was to explore how a generic Internet-based health-promotion program, The Preventive Plan (TPP), containing programs to support behavior change and health information, combined with support from a specialist nurse, could help patients to manage their COPD... Our findings demonstrate that a low-intensity intervention can produce meaningful benefits, and provides learning about the challenges of this approach and the importance of the nurse coach role.
